

Observation Notes

A1: Chi Wang (P1) Observation Notes

- Whilst browsing the features, P1 showed a clear preference for the daily horoscope module and immediately asked: “Is this fortune randomly generated?”
- During the test, P1 repeatedly tapped the fortune-telling button.
- When completing the questionnaire, P1 specifically noted: “I like the daily horoscope feature best, as I’m quite interested in esoteric topics.”
- When asked about areas for improvement, P1 paused briefly before remarking: “Overall, it’s quite good, but it could do with some new features or gameplay elements; otherwise, it loses its novelty after a few uses.”
- In Question 6 regarding suggestions for improvement, P1 proposed a specific cultural reference: “If an inauspicious fortune is drawn, could there be a ‘neutralization’ feature, similar to how Japanese shrines have a designated place to tie up bad fortunes to ward off evil and avert misfortune?”
- Overall, P1 expressed appreciation for the emotional value of the fortune-telling feature.

A2: Tong Lu (P2) Observation Notes

- P2 first expressed a clear interest in the temperature and humidity monitoring function, saying: “I grow plants, so I often need to check changes in temperature and humidity; this is quite handy.”
- Whilst browsing the character illustrations in different modules, P2 suddenly frowned and pointed at the screen: “The background of the fortune-telling image here is white, whereas the others are transparent; it looks a bit odd.” Subsequently, in the questionnaire, they wrote: “The illustrations for each feature are different, but the image in the fortune-telling section has a white background, which looks out of place.”
- Whilst trying out the interactive features, P2 tapped the sprite’s response button several times in succession, then looked up and asked: “Can it only reply to me? Can I actually say something to it myself?” In the questionnaire, they explicitly noted: “The interaction feature is too basic; it’s only one-way. It would be better if some two-way dialogue features could be added.”
- Throughout the testing process, P2 was attentive and observant of details, paying particular attention to whether the features could truly integrate into their daily life.

- Finally, P2 reiterated their expectation for two-way communication, believing this is the key to transforming the app from a “tool” into a “companion”.

A3: Junyu Jin (P3) Observation Notes

- After learning about the product concept (providing companionship for people unable to keep real pets), P3 nodded and said, “That’s a thoughtful idea. I really don’t have time to look after a small animal, but I’d still like some company.”
- Whilst using the feeding function, P3 fed the pet several times in succession, remarking, “This reminds me of how I used to feed my virtual pet at the same time every day when I was a child.”
- Regarding areas for improvement, P3 suggested directly in the questionnaire: “Since the Pokémon concept has been adopted, why not try adding the ability to speak?”
- When asked about areas for improvement, P3 offered a more practical suggestion: “Since this is a lifestyle app, you could try making it more practical, such as adding a to-do list.”
- Overall, P3’s participation demonstrated a strong emotional connection, viewing the creatures as virtual pets and hoping the product could take on a greater role in providing companionship and managing daily life.

A4: Zizhu Qian (P4) Observation Notes

- P4 appeared very excited upon seeing the Pokémon-style character designs.
- Whilst exploring the features, P4 tapped on almost every module and showed great interest in the illustrations for each function.
- In question four of the questionnaire, P4 wrote: “ I’m quite interested in Pokémon myself; the whole concept has that sense of collecting and companionship. Plus, being able to see daily temperature changes in real time makes it both practical and fun.”
- However, when trying out abstract features such as ‘Evolution’ and ‘Skills’, P4 looked somewhat confused and later commented: “These features are a bit too abstract and lack that sense of companionship. It would be better if more everyday, practical features were added.”
- Regarding areas for improvement, P4 suggested: “You could add some new practical features, such as reminding me of the next task I need to tackle.” This directly corresponded to the To-Do List feature that was subsequently added.
- P4’s feedback clearly reflected their expectation of a balance between “entertainment value” and “everyday practicality”.

A5: Zhengran Wu (P5) Observation Notes

- When using the product, P5 went straight to the weather data module, quickly scanned the temperature, humidity and air pressure information, and then tried out the AI chat function.
- They spent quite some time on the AI chat interface, but whilst trying out the fortune-telling module, they pointed to the sprite image and said: “This sprite is cute, but why does it have a white background? The images elsewhere don’t have one, so this looks a bit rough.” This feedback was included in the questionnaire: “The sprite in the fortune-telling module has a white background behind it, which makes it look less refined.”
- Despite pointing out the issue with the image, P5 remained positive in their overall assessment, stating, “I think this is a very promising and interesting app,” and describing all the features as “quite good”.
- P5 seemed to have high expectations for the product’s atmosphere and concept, but keenly noticed the inconsistency in the visual presentation; their feedback was rational and specific.
- They did not propose any further suggestions for functional improvements, focusing instead on the polish of the final version.

A6: Zhaocheng Zhang (P6) Observation Notes

- P6 initially showed a keen interest in the Pokémon concept, repeatedly browsing the character illustrations.
- He spent a considerable amount of time on the fortune-telling feature; after drawing four times in a row, his tone became somewhat resigned: “Three out of four were bad fortunes—that’s just terrible luck. Could you adjust the odds a bit?” He wrote the same comment in the questionnaire.
- Furthermore, in the additional comments section, P6 raised a very pointed yet important question: “You’ve used Pokémon character designs – are you certain there are no copyright issues?”
- P6’s feedback reflects his high level of approval of the product concept, whilst also demonstrating a clear understanding of content delivery and commercial risks.

The above observations are based on six valid questionnaires and on-site notes from user testing conducted between April and May 2026.
